

Point Class Reference

The Point class represents a point (x,y,z) in 3D space. [More...](#)

```
#include <point.h>
```

Detailed Description

For the sake of simplicity, **Point** is implemented as a typedef of Qt's [QVector3D](#).

Example of use:

```
#include "point.h"
#include "vector.h"

// create two points
Point p = Point(0.0, 0.0, 0.0);
Point q = Point(1.0, 0.0, 0.0);

// get coordinate values
float x = p.x();
float y = p.y();
float z = p.z();

// set coordinate values
p.setX(2.0);
p.setY(4.0);
p.setZ(2.0);

// common operations
Vector v = p - q; // point subtraction (returns a Vector)
Point r = 0.4*p + 0.6*q; // barycentric combination
```
